"Prospects of the Application of the Melting Cyclone for the Production of Melted Refractories"

Moscow, Ogneupory, No 5, 1973, pp 50-54

Abstract: The process of cyclone melting was investigated with a view to produce melted refractories of the magnesium-spinel and brazilite-corundum types. Experiments were carried out at the Institute of the Problems of Material Science of the Academy of Sciences UkrSSR. The experiments indicated the possibility of applying melting cyclones with the use of a blast enriched with oxygen for the production of cast fused refractories with a 1800-1900°C fusion temperature in which the melt aggregates in the warming forehearth for aftercasting into molds. The dust removal in cyclone melting does not exceed 5%, thus ensuring the production of a melt which is close to the initial charge in chemical composition. The optimum content of oxygen in the blast at an approximate natural gas consumption of 1.5 nm³/kg charge was determined.

"The Feeding Activity on Man of Fleas From the Common Vole of the Transcaucasian
Upland"

Leningrad, Parazitologiya, Vol 4, No 3, May/Jun 70, pp 271-273

Abstract: Thousands of specimens of six species of fleas which are common
parasites on voles in the Transcaucasian upland plague focus, were tested for
their feeding habits on man. Most of the fleas, among them many young hungry
ones, were reluctant to feed on man, when placed on a human body for 10 minutes
to 24 hours. Out of hundreds of fleas, one might have fed on man. However, three
species of fleas: *Ceratophyllus caspius*, *Ceratophyllus consimilis*, and *Frontopsylla*
elata caucasica, did feed on man in a 10 minute exposure in 1.4, 7.5 and 4.0% of
cases respectively. *Frontopsylla elata*, however, harbors plague bacteria for only
a limited time. The *Ceratophyllus* species can be expected in the transmission of
plague from rodents to man, since they, feed readily on the vole, and are consid-
ered of epidemiological importance.

"Nonlinear Vibrations of the Armature of an Electromagnetic Motor"

VI Mezhdunar. konf. po nelineynym kolebaniyam. Poznan', 1972 (Sixth International Conference on Nonlinear Oscillations. Poznan', 1972), Varshava, 1972, pp 91-92 (from RZh-Mekhanika, No 3, Mar 73, Abstract No 3V285)

Translation: Nonlinear oscillations of the armature of an electric motor that arise upon impacts on the rigid arresting device for fluctuation amplitude are investigated. Cases are considered when the impact is ideally elastic and when there occurs a partially plastic impact with a given restoration coefficient. In steady-state processes without considering friction, the armature is represented in the form of a system with one degree of freedom excited by a harmonic perturbing force and periodic impacts of the same period, but with a phase shift, thus modeling the effect of contact with the amplitude arresting device. Analytical expressions are given describing the linear and nonlinear fluctuations in the case of elastic and partially plastic impact, their areas of existence are determined, and conditions for the rise of oscillations with impact and their maintenance are established when the perturbing force becomes less than a magnitude at which nonlinear phenomena arise. V.S. Gontkevich.

Lieutenant-Colonel of the Medical Service "V. V. ~~1940-1941~~ On the long-term results of the treatment of a criminal ~~element~~ "Furber".

In order to study the effect of the treatment of cerebral lesions during their acute stage, an analysis has been carried out of the long-term results of the treatment of 71 patients at a Russian hospital during the period of from 1944 through 1956. In 51 of these patients, a clinical examination was systematically carried out. In 13 cases the examination was more thorough, and in 7 cases there was a confirmation.

After treatment, all patients were discharged in a satisfactory condition, and only in a very small number of them were there any residual manifestations of inflammation. In addition, we were able to identify significant pathological changes. After discharge from the hospital, the patients had under active observation at their own doctors as well as of their children hematologists and civilian specialists.

This study of long-term results showed that the patients who had suffered complications, had to be discharged from the study because of the treatment being discussed. With the exception of five patients with permanent brain damage, all patients were treated in the hospital and were able to complete both series of exercises and follow-up health check treatment. Very few had to be conditionally discharged from the study. The remaining 60 patients found no need to report for further medical attention.

Received in February 1959.

"Passive Prophylaxis of Experimental Gas Gangrene Caused by *Cl. Perfringens* Types A, B, C, D, E, and F"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 11, 1971, pp 101-105

Abstract: Guinea pigs were infected with one of six types of *Clostridium perfringens* and, one hour later, given one of four types of antitoxic sera. The results revealed poor cross effectiveness. In all cases, homologous antisera were 100% effective in preventing the development of gas gangrene. However, antiserum A protected only 80% of the animals infected with strain C, 60% of those infected with strain B, 50% of those infected with strain F, 30% of those infected with strain D, and 10% of those infected with strain E. Antisera B, D, and E were even less effective in preventing gas gangrene and death caused by heterologous toxins. It is concluded that the conventional administration of just the A type antitoxic serum to human patients is an inadequate prophylactic measure.

"The Role of *Cl. perfringens* Types A, B, C, D, E, and F in the Etiology of Gas Gangrene"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 8, 1971, pp 116-121

Abstract: Study of cultures of strains of *Cl. perfringens* types A, B, C, D, E, and F, isolated from different sources and obtained from a number of collections, showed that all were capable of producing lethal toxins in guinea pigs. But some of the strains (B 200, C AMO, D 91) after long storage ceased to synthesize lecithinase on nutrient media and did not cause gas gangrene in animals. Although they died with symptoms of poisoning, they did not exhibit the local tissue changes characteristic of the disease. The inability of these strains to cause the disease indicates that the clinical picture and pathological changes typical of experimental gas gangrene are closely related to the production of lecithinase. The activity of the toxins in an exudate from diseased tissues was two to four times greater than in artificial culture media. Thus, even weakly toxin-forming *Cl. perfringens* strains in soil may cause gas gangrene when they enter an open wound.

Yerevan, Armyanskiy Khimicheskiy Zhurnal, Vol 25, No 8, 1972, pp 683-688

Abstract: Tryptamines condensed with diphenylacetic acid and diphenylpropionic acid chlorides yield amides which can be converted to corresponding secondary amines by lithium aluminum hydride reduction. Bischler-Napieralski cyclization of these amines with phosphorus oxychloride yields 1-acylalkyl substituted tetrahydro- β -carbolines which when condensed with formaline yield benz(g)indolo(2,3-a)-7-R-14-phenyl-5,7,8,13,13b,14-hexahydroquinolizines and 5H-benz (5,6)azepino(1,2-a)-7-R-15-phenyl-7,8,13,13b,14,15-hexahydro- β -carbolines. Most of these compounds exhibited short-lasting hypotensive activity.

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 12, Dec 71, pp 1683-1687

Abstract: Condensation of 6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline with diphenylacetic- and diphenylpropionic acyl chlorides gave respective amides -- N-(2-diphenylacetamido)- and N-(2-diphenylpropionamido)-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline, m.p. 133-134° and 145-146° respectively. These products were reduced with LiAlH₄ to tertiary amines and converted to hydrochlorides: N-(β-diphenylethyl)- and N-(γ-diphenylpropyl)-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline, melting at 173-174° and 179-180° respectively. When 1-phenyl- or 1-p-methoxyphenylaminomethylcyclohexane was used in above condensation, the products were 1-(acetamidomethyl)-1-phenylcyclohexane and 3,4-dimethoxyphenylethylamide of diphenylpropionic acid. Cyclization of these amides followed by LiAlH₄ reduction yields respective tetrahydroisoquinolines.

"Small GDFI-3 Pulse-Phase Laser Range Finder with Digital Output"

Leningrad, Optiko-mekhanicheskaya promyshlennost', No 7, 1972, pp 23-27

Abstract: The GDFI-3 pulse-phase laser range finder is described. It is a further development of a previously described device [V. N. Deryagin, et al., Optiko-mekhanicheskaya promyshlennost', No 6, 27, 1970; No 12, 27, 1970]. The circuitry has been simplified appreciably, and provision has been made for high speed and data output on a digital display. The mathematical description of the method on which the range finder is based, a block diagram of the device and a description of an experimental model are given. Instead of the usually measured interval $\Delta t = 2D/c$, the interval τ_T obtained as a result of linear transformation is measured [$\tau_T = \Delta\phi T_{\text{intermediate}}/2\pi$ where $\Delta\phi$ is the phase shift between the signal and reference voltages, and $T_{\text{intermediate}} = 1/F_{\text{intermediate}}$]. The test results show that the range to a corner reflector about 100 cm² in area is no less than 12 km and to diffusely reflecting objects, ~250 meters. The measurement accuracy is ± 5 cm.

be developed.

It is suggested that a set of properties be sought, the information content of which is no less than the information content of a certain fixed set of properties. Asymmetrical and symmetrical coupling factors between properties are sought, and a suggested algorithm for running through the information subspaces is described, based on determination of the close components of connection of properties. A generalized block diagram of the algorithm is presented. 37 Biblio. Refs.

collection of works), 1972, pp 150-179 (from RZh-Matematika, No 1, Jan 73,
abstract No 1V858 by E. Vagner)

Translation: The problem of finding informative aggregates of properties is usually solved in the following way: First, some method is assigned for evaluating the informability of individual properties; then considerations are pointed out which enable approximate determination of informative aggregates of properties as aggregates of independent and individually informative properties. In most methods of determining informability the informability of the aggregate of properties cannot be less than the informability of any component subaggregate and, as a rule, is expressed by a single number. The trial and error method is used in searching for the optimum aggregate of properties. Clearly there can be no procedure which avoids a very "extensive" sorting process which is suitable for all cases.

"Kinetics of Thermal Dissociation of GaP and GaAs Under a Layer of Flux"

Moscow, Doklady Akademii Nauk SSSR, Vol 204, No 6, 21 Jun 72, pp 1419-1421

Abstract: The authors investigated the kinetics of thermal dissociation of gallium phosphide and gallium arsenide under a layer of B_2O_3 doped with Na_2O , SiO_2 and GeO_2 at various pressures of argon. The process of vaporization of the volatile component of the compound -- formation and growth of the gas bubble, its detachment from the molten semiconductor and rise in the flux -- was observed visually and photographically. The rate of dissociation was determined from the number and sizes of bubbles escaping from the interface between phases or from the change in weight of the specimens. The results show that the vaporization of arsenic and phosphorus in the process of dissociation of gallium arsenide and gallium phosphide under molten flux is limited by the processes for formation and growth of bubbles. These processes depend on the external pressure of the inert gas and may be controlled by changing the composition of the flux. The pressure which prevents or

"Hygienic Assessment of the Effects of Exposure to Heat"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 3, 1973, pp 12-15

Abstract: Rabbits and rats exposed to infrared radiation at the rate of kcal/m²/hour for varying lengths of time exhibited changes in body weight, behavior, immunological reactivity (decrease in antibody titers and phagocytic activity of leukocytes), hormonal activity, tissue respiration in the liver and skeletal muscles, oxidative phosphorylation, etc. The magnitude of the changes varied with the duration and nature of the exposure (continuous or intermittent), intensity of radiation, relationship between time of irradiation and rest periods, etc. Infrared radiation also brought about changes in humans. The heart rate, blood pressure, body temperature, etc. were affected, the degree varying mainly with the intensity and duration of exposure, and the length of the interval between exposures.

"Experimental Study of the Structure of Turbulent Boundary Layers in an Incompressible Fluid with a Longitudinal Pressure Gradient"

Moscow, Gidromekhanika, No 17, 1971, p 44-50.

Abstract: Results are presented from an experimental study of the structure of turbulent boundary layers developed in the initial sectors of confusers and diffusors with smooth and rough walls. Data are presented on the distribution of averaged and pulsation flow velocities and Reynolds transverse shear stresses in the cross sections of boundary layers with positive and negative pressure gradients. The specifics of the kinematic structure of these flows are studied.

"Structure of Fluid Flow Under Conditions of Transition from Laminar to Well-Developed Turbulent Flow"

Gidravlika i gidrotekhn. Resp. mezhd. nauch.-tekhn. sb. (Hydraulics and Hydraulic Engineering. Republic Interdepartmental Scientific and Technical Collection), 1971, vyp. 11, pp 34-43 (from RZh-Mekhanika, No 7, Jul 71, Abstract No 7B569)

Translation: The paper presents the results of experimental studies of kinematic and dynamic characteristics of a two-dimensional flow of incompressible fluid in a smooth rectangular tube in the region of transition from laminar to well-developed flow conditions. Data are obtained which characterize the nucleation and development of turbulent pulsations in the flow, the nature of the distribution of these pulsations is shown, and quantitative evaluations are given. It is shown that determining the magnitude of tangential stresses on the wall from the data of structural measurements is good practice and agrees with the results of direct measurements. "Obtaining and Studying Some Electrophysical Properties of Baked Tablets of Cadmium Sulfide and Selenide"

Kiev, Poluprovodnikovaya tekhnika i mikroelektronika, No 6, 1971, pp 55-58

Abstract: A simple process for obtaining low-resistance ($\rho = 0.5-20$ ohms-cm) baked tablets of cadmium sulfide and selenide has been developed suitable for manufacturing photoelements of the heterogeneous type. Some of the properties of these elements are investigated. The resistance of the tablets decreases with an increase in the roasting temperature, and the density of the tablets also increases. The specimens obtained were always n-type; the current carrier concentration varied from $10^{15}-10^{18}$ cm⁻³, the mobility was within the limits of 1-50 cm²/volt-sec for cadmium sulfide, for cadmium selenide, the mobility was about 100 cm²/volt-sec, and the concentration was $10^{16}-10^{18}$ cm³ at room temperature.

"Some Properties of Photoconverters Based on Pressed Caked CdS Tablets"

Kiev, Poluprovodnikovaya tekhnika i mikroelektronika, No 6, 1971, pp. 101-107

Abstract: The results of studying a number of photoelectric and electrical properties of photoconverters based on pressed caked CdS tables are described. The possibility of obtaining effective photoconverters on the basis of such tablets was demonstrated previously [St. Kynev, et al., Acta Phys., Pol., No 25, 313, 1964; A. I. Marchenko, UFZh, No 12, 1392, 1967]. A procedure for manufacturing the tablets is also described. The photoconverters have high sensitivity in the entire visible range of the spectrum. The efficiency of converting the energy of solar radiation to electric energy is 3.5 percent. The sensitivity of the photoconverters in the long wave range of the spectrum is basically determined by the extrinsic absorption of light in CdS. The volt-ampere and volt-capacitive characteristics of the $p\text{-Cu}_{2-x}\text{S-n-CdS}$ heterojunction were investigated in a broad temperature range. The return branches of the volt-ampere characteristics do not reveal the current saturation section. The volt-ampere curves are characterized by "soft" breakdown usually observed in heterojunctions and the presence of excess currents appreciably exceeding the calculated values with respect to magnitude for materials with a CdS width of $1/2$

MARCHENKO, A. I., et al., Poluprovodnikovaya tekhnika i mikroelektronika, No 6, 1971, pp 101-107

the forbidden zone. The magnitude of the critical voltage corresponding to the direct current increases with a drop in temperature. The negative temperature coefficient of the critical voltages is characteristic of Zener tunneling. Thus, the tunnel mechanism of passage of the current through the junction is indicated.

"Some Characteristics of Photoconverters Using Pressed Sintered Tablets of CdS"

Kiev, Poluprovodnikovaya tekhnika i mikroelektronika, No. 6, 1971, pp 101-107

Abstract: This article is the latest of a series of four dealing with photoconverters and published by the same authors. The first three demonstrated the possibility of fabricating photoelectric converters from sintered tablets of cadmium sulphide and selenide; the present article gives the results of investigations of the photoelectric and electrical characteristics of the CdS converters. The method for preparing the converters, from the initial material of the ETO 021009 TU brand to the final product, is described. The spectral characteristics of the converters are discussed, and a curve of the spectral short-circuit current distribution for two types of converter is plotted; the volt-ampere and volt-capacitance static characteristics of the heterojunction $p\text{-Cu}_{2-x}\text{S--n-CdS}$ are investigated in a broad range of temperatures.

"Heterogeneous Solar Transducers Based On Polycrystalline Cadmium Sulfide And Cadmium Selenide"

Poluprovodn. tekhn. i mikroelektronika. Resp. mezhd. sb. (Semiconductor Technology And Microelectronics. Republic Interdepartmental Collection), 1970, No 4, pp 112-121 (from RZh--Elektronika i yeye primeneniye, No 8, August 1970, Abstract No 88218)

Translation: This paper gives the results of development of polycrystalline phototransducers based on cadmium sulfide and cadmium selenide. The method of preparation and the photoelectric and electrical properties of the devices are described. The phototransducers possess high photosensitivity in all the visual region of the spectrum. The efficiency of conversion of the energy of solar radiation into electricity is ~ 3 percent. The photocells are characterized by a high stability of their parameters in time. Using as an example studies of the electrical (voltage and voltage-capacitance) characteristics of heterogeneous $p(\text{Cu}_{2-x}\text{Se})-n(\text{CdSe})$, conclusions are drawn concerning the prevalence of the tunnel-recombination process in the mechanism for passage of the current through the heterogeneous system developed. 8 ill. 1 tab. 11 ref.

"A Liner for Spot and Roller Welding"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 5, 1970, p 74, patent No 261602, filed 6 Nov 68

Abstract: This Author's Certificate introduces a liner for spot and roller welding of aluminum-magnesium alloys. This liner, in the form of a strip, is introduced into the zone of the welded seam mainly for checking penetration. As a distinguishing feature of the patent, inspection quality is improved and the corrosion strength of the welded joint is increased by making the strip from an alloy of aluminum and manganese taken in the following percent ratio: manganese -- 5-6%, and the remainder aluminum. The thickness of the strip is 7-8% of the thickness of one of the plates being welded.

"Fixed Semiconductor Resistors"

Kiev, Izvestiya VUZ--Radioelektronika, Vol 13, No 11, 1970, pp 1391-1393

Abstract: This brief communication reports a solution to the vexing problem of manufacturing precision, low-ohm resistors designed to operate in a wide temperature range. The material used is monocrystalline silicon with a high concentration of impurities. A cutaway view of the new resistor shows it to have the same shape and structural design as standard types. The process of its manufacture is given in some detail. A curve showing the tolerated electrical load as a function of the temperature is flat from 0 to 150°C, but drops off sharply and linearly to zero tolerated load at 275°C. A second curve of the temperature coefficient of resistance as a function of the silicon resistivity shows a rise in the temperature coefficient from 7 to 11%/degree over a resistivity range of 0.01 to 0.1 ohms cm. These resistors are designed for circuits requiring low temperature factors and high resistor accuracy. They have the added advantages of low noise level and the ability to sustain short-term overloading.

"Tris(N-alkyl-N-phenyl)amides of Phosphoric Acid"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 9, Sep 73, pp 1900-1903

Abstract: Tris(N-methyl-N-phenyl)- and tris(N-ethyl-N-phenyl)amides of phosphoric acid (I) and (II) were synthesized by reacting a mixture of 50 ml ether, 0.105 g-mole of phosphorus trichloride and 0.4 g-mole of triethylamine at 0° stirred in a stream of argon with a solution of 0.35 g-mole of methyl-aniline in 150 ml ether. The mixture is refluxed for 3-4 hrs, cooled to 10°, the precipitate is separated, mixed with 300 ml chloroform, cooled to 10° and the product is crystallized from chloroform. It was shown that the (I) and (II) described in previous literature are actually N,N'-dimethyl-N,N',N''-triphenyltriamide of phosphoric acid, its N,N'-diethyl homologue and N-ethyl-N,N',N''-triphenyltriamide of phosphoric acid.

"Hydrogenation of Organophosphorus Compounds. Part V"

Leningrad, Zhurnal Obshchey Khimii, Sep 71, Vol 41, No 9, pp 1944-1950

Abstract: This paper is one of a series of investigations on the hydrogenation of organophosphorus compounds containing aromatic radicals. It is shown that mixed oxides of tertiary phosphines, phosphinic and phosphonic acids as well as phosphoric acid amides with phenyl and benzyl radicals will be hydrogenated in the presence of a platinum catalyst to form corresponding compounds with cyclohexyl and cyclohexylmethyl radicals; the phosphoric acid amides will be hydrogenated at a higher rate (at room temperature) than oxides and acids. Unlike the initial compounds, all hydrogenated products featured lower melting points and higher solubilities in ordinary organic solvents. When treated with phosphorus pentachloride, bis(cyclohexylmethyl) phosphinic acids form their acid chlorides -- readily mobile liquids, distillable under vacuum. When treated with propylmagnesium iodide, bis(cyclohexylmethyl)phosphinic acids form an oxide of propylbis(cyclohexylmethyl)phosphine which is identical to the hydrogenation product of

propyldibenzylphosphine oxide. The experimental section of this paper is presented in great detail and includes tables citing yields, melting points, solvents for crystallization, formulas, solubilities and other indicators for phosphoric acid trialkylamides $(RNH)_3PO$, phosphoric acid tris(cyclohexyl)amides $(RNH)_3PO^a$ and other related compounds.

MARCHENKO, A. S.

PROBLEM OF LINEAR STATISTICAL FORECASTING WITH UNCERTAINTY IN THE DATA

UDC 551.509.314

Article by Candidate of Physical and Mathematical Sciences A. S. Marchenko, Computer Center of the Siberian Division of the USSR Academy of Sciences, Moscow, *Metrologiya i Dirologiya*, Russian, No 2, 1972, submitted 1 July 1971, pp 15-20.

It is demonstrated that when using the set regression equations in the case where the real covariances between the predictors are zero, neglecting the sampled mutual covariances, however small, lowers the quality of the forecast compiled on the basis of data independent of the archive sample.

From the predictors y_1, y_2, \dots, y_n let us form the vector $\vec{y} = (y_1, y_2, \dots, y_n)$ (here and hereafter the vector with the stroke is interpreted as the row vector). Let the predicted variable (the predictant) be y_0 and the true mean value and covariance matrix of the vector component, the predictant + the predictor $\vec{y} = (y_0, \vec{y}_1)$ equal

$$\vec{y} = M\vec{y} = \begin{pmatrix} y_0 \\ \vec{y}_1 \end{pmatrix}, \quad \Sigma = \text{cov}(\vec{y}, \vec{y}) = \begin{pmatrix} \sigma_{y_0}^2 & \sigma_{y_0, \vec{y}_1} \\ \sigma_{\vec{y}_1, y_0} & \sigma_{\vec{y}_1, \vec{y}_1} \end{pmatrix}, \quad (1)$$

respectively, where M and cov are the operators of mathematical expectation and covariance. It is known that in the class of linear forecasts, the forecast of the type

$$\hat{y}_0 = y_0 + \sigma_{y_0, \vec{y}_1} (\vec{y}_1 - \mu_1), \quad \sigma_{y_0, \vec{y}_1} = \sigma_{y_0, \vec{y}_1}^{-1} \sigma_{y_0, \vec{y}_1} \quad (2)$$

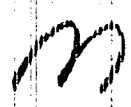

has a minimum mean square error equal to

$$\sigma_{y_0}^2 - M(y_0 - \hat{y}_0)^2 = \sigma_{y_0}^2 (1 - \rho^2), \quad \rho^2 = \frac{1}{\sigma_{y_0}^2} \sigma_{y_0, \vec{y}_1} \sigma_{\vec{y}_1, y_0}^{-1} \sigma_{\vec{y}_1, \vec{y}_1} \quad (3)$$

In these formulas \vec{y}_0 is the true vector of regression of y_0 by \vec{y}_1 , and $\rho = \sigma_{y_0, \vec{y}_1} / \sigma_{y_0} \sigma_{\vec{y}_1}$ is the true set correlation coefficient between y_0 and \vec{y}_1 .

"Boundary Value Problems for Second-Order Elliptic and Parabolic Operators on Infinite-Dimensional Manifolds With Boundaries"

Moscow, Matematicheskii Sbornik, Vol 90(132), No 3, Mar 73, pp 331-371

Abstract: The article studies second-order elliptic and parabolic operators on a special class of infinite-dimensional manifolds (so-called CL-manifolds). In studying the Dirichlet problem for elliptic and parabolic differential operators given on CL-manifolds with boundaries, the main thing, just as in the finite-dimensional case, is to study the corresponding boundary value problem in the half-space $H_1^+ = \{x \in H_1 : x_1 \geq 0\}$. In case of constant coefficients, an infinite-dimensional analog of Poisson's formula is found to solve the Dirichlet problem in the half-space. It is proved that the corresponding Poisson kernel is a measure in H_1^+ (generally speaking, complex-valued). In the case of variable coefficients, the Poisson kernel obtained by freezing the initial operator makes it possible to construct its regularizer.

1/2

USSR

VSHIK, M. I., and MARCHENKO, A. V., Matematicheskiy Sbornik, Vol 90(132), No 3, Mar 73, pp 331-371

An operator of the form $\hat{L}(x, \xi) + \zeta$ is considered on the CL-manifold M , where $\hat{L}(x, \xi)$ is a second-order elliptic differential operator and $\zeta \in \mathbb{C}$. For sufficiently large $\text{Re } \zeta$ proof is given of the unique solvability of the Dirichlet problem for the operator $\hat{L}(x, \xi) + \zeta$. This result is used to study the corresponding parabolic problem.

The results are generalized for some classes of higher-order elliptic and parabolic operators similar to those considered in an earlier article by M. I. VISHIK and P. M. BLEKHNER.

Moscow, Voprosy Virusologii, No 1, Jan/Feb 71, pp 10-16

Abstract: In order to evaluate the significance of antiviral antibodies in the development of chronic infection, it is necessary to study them in combination with other immunological factors under natural conditions. Consequently a serum against the infected cells was used to produce chronic infection in a tissue culture. J-96 cell cultures were inoculated with Coxsackie B₂ virus and L cells with vesicular stomatitis virus, and then cultured in the presence of antisera against the infected cells. In 7 of 14 tests with J-96 cultures and in 3 of 4 tests with L cultures, cell strains with properties differing sharply from the original ones were obtained. Starting with the 9th passage, when the cultures were no longer treated with the
1/2

SOVETOVA, G. P., et al., Voprosy Virusologii, No 1, Jan/Feb 71, pp 10-16

antiserum, and for the remaining observation period (22-48 passages), the cell cultures did not degenerate. The respective viruses were detected in all cell strains. Cytophysiological, morphological, and cytochemical studies were performed, the content of acid-soluble proteins in the various cell cultures, and succinate dehydrogenase activity in the culture cells were determined. During the entire observation period, chronic infection never became acute even when no antiserum was in the culture medium. The cultures were highly resistant to superinfection and differed from normal cultures by a considerably reduced content of acid-soluble proteins and by their cytomorphological and histochemical properties.

"The use of Boiler Aggregates of Heat Electrostations for Purification of Ventilation Emissions from Chemical Fiber Plants"

Kiev, Energetika i Elektrifikatsiya, No 4 (70), Jun/Jul 73, pp 8-10

Abstract: It has been shown that in principle it is possible to purify sulfur-containing air from chemical fiber plants by passing it through the furnace of power plant boilers serving as the air blast. Currently this appears to be the most simple, economically desirable and practically the only method capable of detoxifying small admixtures of hydrogen sulfide and carbon disulfide in large volumes of diluting air.

237722 BIOCHEMICAL TESTING OF WASTE WATER is more reliable and more accurate. Vessel 1 is connected to the compensating bottles 2 and 3 through an electrolyser 4 and a pressure regulator 5. The regulator is connected with a level indicator 6, an amplifier 7, a relay 8 and a recorder 9. 1 litre of waste water (sample) with active sludge is placed in the vessel. A container 10 with 10% solution of KOH is placed to absorb carbon dioxide. Oxidising of organic matters accompanies the demand for diluted oxygen and subsequent diffusion of it from gas 11 to a liquid. The pressure of gas increases due to the fact that

electrolyser 4 produces oxygen by the electrolysis of an anode A. When it is equal to the pressure in the bottles 2 and 3, the electrolyser is automatically cut-off. The current to the electrolyser is regulated by a resistance R and the duration of the cycle is controlled by a timer 12. Hydrogen from cathode R is absorbed in 13. Mixing of sample is done magnetically 14 and the complete assembly is submerged in a thermostatically controlled water bath 15. 17.4.67, as 1149716/13-26.

A70-23156 # Analysis of the dispersion equation for a three-dimensional periodic structure (Analiz dispersionnogo uravneniya trekhmernoi periodicheskoi struktury). L. S. Berlanson and T. A. ~~Tikhonov~~ ^{Tikhonov}. Radiotekhnika i Elektronika, vol. 18, Feb. 1970, p. 263-277. In Russian.

Outline of a method of analyzing the dispersion equation for a three-dimensional periodic structure, based on the representation of this equation in the form of a superposition of partial characteristics related to individual spatial harmonics of a two-dimensional array. The overall analysis of this equation for various structural parameters is illustrated by graphs plotted for the cases of two and three spatial harmonics. An analytical solution of the dispersion equation is given for the case of two harmonics.

"Continuous Artificial Respiration in Botulism"

Leningrad, Vestnik Khirurgii imeni I. I. Grekov, Vol 104, No 5, May 70, pp 115-116

Abstract: Botulism, although rare, is significant because of its high mortality rate (76.5% in England, 65% in the United States, and 24.5% in the USSR). The poison paralyzes the motor nerves, and death results from respiratory paralysis. A case study is presented of a 32-yr old patient who was brought to the hospital on the 3rd day of illness in very serious condition, with paralysis of the throat, partial paralysis of the muscles of the face and eyes, a pulse rate of 120, BP 180/100, breathing very difficult, low tone of the trunk and leg muscles, and with all reflexes suppressed but with sensation unimpaired. On the 2nd day after admission, spontaneous respiration ceased, the throat became completely paralyzed, reflexes were absent, deep cyanosis set in, the abdomen was distended and paralyzed, and the heart was thumping. Oxygen was given through intratracheal intubation, and the following day the patient was placed in a respirator; inspiration was forced under 10 mm pressure, expiration was free. The patient was fed artificially, and sera, antibiotics, vitamins, analeptics, and proteolytic enzymes were given to prevent embolisms. The trachea and larger bronchi were

1/2

instituted, and on the 90th day the respirator was removed. On the 110th day the intratracheal tube was removed. On the 170th day the patient was discharged in fair condition, with insignificant lability of the pulse.

"The 'Ferment-1', a Device for Identifying Microorganisms by Their Proteolytic Activity"

Moscow, Meditsinskaya Tekhnika, No 1, 1970, pp 16-17

Abstract: The proposed device is based on the release of ammonia microorganisms, E. coli in particular, under the influence of proteolytic enzymes. The amount of ammonia released is recorded in a high-frequency conductometric apparatus that uses a differential scheme of measurement in recording the electrical conductivity of a solution under study. The procedure takes 30-40 min, a fraction of the time required to identify ammonia by the conventional biochemical methods. The device was tested on an E. coli culture that does not form ammonia. The electrical conductivity of solutions with and without a specific reagent did not change.

"Pictumine -- a new Alkaloid from Cynoglossum Pictum"

Tashkent, Khimiya Prirodnikh Soyedineniy, No 5, 1972, pp 655-656

Abstract: Five alkaloids have been isolated from Cynoglossum pictum Ait., from which one remained unidentified. This alkaloid, m.p. 158-159° is soluble in water, methanol, ethanol, benzene, acetone, and chloroform; it is insoluble in petroleum and diethyl ethers. Its IR spectrum shows absorption bands at 1720, 1705, 1280, 1250, and 1160 cm⁻¹. On the basis of these data a conclusion has been reached that this alkaloid is a new compound, so it was named pictumine.

"Production and Properties of Thick Oxide Films in Titanium"

Moscow, Zashchita Metallov, Vol 9, No 1, Jan-Feb 73, pp 74-77

Abstract: A study was made of the anodic behavior of VT1-1 brand titanium in acid chloride, phosphate-chloride, and sulfate-chloride solutions. The properties of developing anodic films and some utilization areas of anodized titanium were investigated. The joint presence of corrosion in solutions of ion-inhibitors (SO_4^{2-} , PO_4^{3-}) and ion-activators (Cl^{-1}) was found to be essential for the development of a thick phasal film. Areas of corrosion damage and of the development of thick white and thin colored films in systems $\text{HCl-H}_3\text{PO}_4\text{-H}_2\text{O}$ and $\text{HCl-H}_2\text{SO}_4\text{-H}_2\text{O}$ and the anodic film thickness, changing in time, are shown. Obviously, in the titanium-anodic film pair the oxide is the cathode. In connection with high porosity, the thick-layered oxide does not provide corrosion protection of titanium. Three figures, ten bibliographic references.

"Study of Unevenness of Distribution of Deformations in Tensometric Plate"

Vibratsion. Tekhnika [Vibration Equipment -- Collection of Works], Moscow, 1972, pp 166-170 (Translated from Referativnyy Zhurnal Metrologiya i Izmeritel'naya Tekhnika, No 3, 1973, Abstract No 3.32.375), by Ye. V. K.

Translation: An expression is produced allowing calculation of deformation for any point on a plate with dimensions a , b . The results of calculations performed by computer are used to construct graphs of the dependence of deformation of an element of the plate on its position and the ratio of plate dimensions b/a . It is shown that with a ratio of sides of the plate $b/a = 0.02$, the unevenness of deformation does not exceed 10%. Consequently, if the permissible unevenness of stress is on the order of 10%, the ratio of sides of a tensometric plate should be selected not over 0.02. The result produced is applicable to elastic plates made of any material which follows Hook's rule and is practically independent of the modulus of elasticity. 2 figures.

"Programming Algorithms for Processing Tabular Information"

Tr. 3-y Zimn. shkoly po mat. programir. i smezhn. vopr., 1970, vyp. 2
(Works of the Third Winter School on Mathematical Programming and Related Problems, 1970, No 2), Moscow, 1970, pp 300-313 (from RZh-Kibernetika, No 9, Sep 71, Abstract No 9V597)

Translation: The authors describe a library of standard programs for simplifying the programming of printing out documents in the required form, and changing the form of printout and data processing algorithms. The described library was realized on the "Ural-14" computer for the daily accounting system of the slabbing shop at the "Zaporozhstal" Plant. V. Mikheyev.

"Solution of a Special System of Second-Order Partial Differential Equations by the Method of Successive Approximations"

Moscow, Resheniye spetsial'noy sistemy nelineynykh differentsial'nykh uravneniy v chastnykh proizvodnykh vtorogo poryadka metodom posledovatel'nykh priblizheniy (cf. English above), 1972, 10 pp, bibl. 2 titles (manuscript deposited in VINITI 6 Feb 73, No 5459-73 Dep.) (from RZh-Kibernetika, No 7, Jul 73, abstract No 7V660 Dep. by the authors)

Translation: An algorithm is presented for solving a system of two nonlinear differential equations with linear boundary conditions in differential form. The problem is solved by reducing solution of the initial problem to sequential solution of a system of second-order linear differential equations. The number of successive steps depends on the rate of convergence of the iteration process, and also on the required accuracy of the calculations. In the final analysis, the problem reduces to solution of a system of linear algebraic equations in which the unknowns are the sought functions at grid intersections.

"Algorithm for Determination of the Stress State when a Spherical Indentor is Pressed into an Elastic-Plastic Half Space"

Mosk. Aviats. Tekhnol. In-t [Moscow Institute of Aviation Technology], Moscow, 1972, 14 pp (Translated from Referativnyy Zhurnal Mekhanika, No 5, 1973, Abstract No 5V411, by the authors).

Translation: The stress state of a material is studied when a hard spherical indentor is pressed into the flat surface of an elastic-plastic body and is moved along this surface. The three-dimensional vector elastic field of displacements resulting from deformation of the body considering the forces of surface friction is studied in a cylindrical system of coordinates. The equations produced represent a system of quasilinear differential equations with second order partial derivatives and three unknown functions. The solution of the equations in analytic form is not possible. Therefore, numerical methods of solution are used, in particular the grids method. In order to simplify the problem, several assumptions were made concerning the properties of the material of the body. In addition to determination of the instantaneous

"A Single-Conductor Transmission Line"

USSR Author's Certificate No 259195, filed 19 Aug 68, published 28 Apr 70
(from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12B151 P)

Translation: The proposed single-conductor transmission line consists of a section of metal wire with a dielectric coating, two coaxial-horn surface-wave exciters and a tension device of the winch type. To simplify connection of reception and transmitting equipment to the transmission line and ensure tightening of the wire, this wire is seated loosely in a cylindrical hole made through one of the exciters in the central conductor of the branch of the angle connector which is coaxial with the horn. In the tension device, the winding drum is connected to a hand crank through a slip clutch. Five illustrations.
